Implications for the evolution of the vertebrate eye cup. With a degree of caution, one can interpret the developmental sequence described above, together with the findings set out earlier for ascidian, hagfish and lamprey eyes, as potentially providing clues about the evolution of the vertebrate eye.

The vertebrate skeletal system has paramount importance for analyses in evolutionary biology. Because vertebrate skeletons can be viewed as aggregates of apparently discrete units, namely bones, they have attracted the interest of comparative anatomists since even before the dawn of the concept of evolution []. In addition, because bones can be preserved as fossils, comparative research can ...
